/Walter D. Griffin/ Supervisory Patent Examiner, Art Unit 1774			

Continuation of 11. does NOT place the application in condition for allowance because: Regarding applicants' assertion that the structure of Johannes '142 does not provide a vortex in the solvent and/or solute, Johannes '142 teaches a flow pattern that resembles a whirlpool (as recited in Merriam-Webster 1; figures 1-2 show that the first fluid would make a whirlpool path between inlet tube 12 and outlet tube 26). Further, Merriam-Webster definition 2b, which was noted by the examiner in the Final Rejection mailed 02/24/2011, remains a reasonable interpretation of the term "vortex". Whether or not it is the most common of the definitions is irrelevant. Applicants have not argued that Merriam-Webster definition 2b is an unreasonable interpretation. The same holds for the further citations of "vortex" definitions - while these are all reasonable, and most are met by the cited prior art, applicants have not argued that the cited interpretation is unreasonable. Applicants further note that the mixing of the solute and solvent is done by a different flow pattern. This is irrelevant, as the mixing of the two fluids is not claimed to be achieved by vortex, and unclaimed limitations need not be addressed by the prior art or in a rebuttal. The formation of a vortex in the first fluid is sufficient to meet the limitations as claimed.

"Teaching away" is not a relevant consideration in rejections under 35 USC 102(b).

Applicants make several other arguments regarding the differences in the mixing mechanisms between the instant application and the cited prior art. Again the examiner notes that a mixing mechanism is not instantly claimed and the cited prior art teaches a structure which meets the claimed limitations. The vortex formed by the first fluid alone is sufficient to meet the claimed limitations (col. 2, lines 41-46). Differences in terminology do not equate to differences in structure or flow pattern. The examiner maintains that the first fluid forms a vortex-shaped flow pattern in the annular mixing chamber. The mixing mechanism remains irrelevant to the discussion as no mixing mechanism is instantly claimed.
